

## Assignment 1:

In JAVA, we can execute a project from another java project by including the project in build path. Following the steps it can be done:

1. Right click on the project and select properties.
2. In properties, select JAVA build run.
3. From 'projects' tab click on Add button
4. selecting the java project that I want to include in build path.

However, in this exercise, the class 'Main2' in the class containing the main method in the 'anotherproject' JAVA project. The import statement

is used to import the necessary class from the Java project and "Main.main(args)" statement is used to call the main method of the Java project from the main method of the current project ("anotherProject").

In conclusion, adding a Java project to the build path of another project and executing its Main method is a process that involves adding the Java project to the build path and importing necessary classes.
